

ReactOS 0.3.8 is here!

ReactOS is an open-source operating system providing its own compatible implementation of components and APIs that are part of the Microsoft® Windows® NT architecture, which is the foundation of all modern versions of Windows.

The aim of ReactOS is to be capable of running applications and drivers written for Windows, whilst also providing users with a familiar graphical interface and applications.

Not everyone is comfortable using an alternative operating system. However, users who are familiar with Windows will be able to use ReactOS with ease. The user experience should be the same, and their applications and drivers should work.

There are also the benefits provided by the GPL over a restrictive commercial license. You can't argue with freedom, can you?

Windows is a registered trademark of Microsoft Corporation in the United States and other countries.

- ReactOS is not a Linux distribution, however it does share code with the WINE project for many components.
- Although ReactOS is still an alpha-stage operating system, it is able to run a number of popular Windows applications.
- Find out more at www.reactos.org
